

LAB 01:

- Using the techniques that you learned in this section, use Ansible to display the list of users available on a remote system. (hint: you can use `cat /etc/passwd` for the command to be executed remotely).

LAB 02:

- Write an Ansible playbook that will install an FTP server. Ensure that the service is started after installation and that it will start automatically when the system boots (hint: the package name is `vsftpd` on Centos and Ubuntu)

LAB 03:

- Modify the previous playbook to also edit `/etc/vsftpd.conf` and ensure that the following line is present and uncommented: `local_enable=YES`
