LABs

1. Using the knowledge acquired in this section, create a new Vagrant machine running bento/centos-7.3.
2. Crete a web server using Apache on the machine that you've just downloaded. Hint: the web server in Centos is referred to as httpd and the package manager is yum.
3. Deploy a MySQL database on the machine.
4. Split the Vagrant machines you created so that one contains the web server and the other one contains the MySQL database.
